Posted to Google Drive instead of GitHub due to some firewall errors coming from my home server.

To download the exe file, right click on the folder and click download. Once downloaded extract the files. From here open the folder and run the .exe.

To open the application first install Unreal Engine 4 from the Epic Games store. After this download the project files from my Google Drive. Once downloaded extract the files. Finally, move the entire extracted folder into the Unreal Engine 4 unreal projects folder. If you cannot find this folder you can create a project of any sort, after if you view this project within the Unreal Engine library from the Epic Games Launcher and hover your mouse cursor over it, you will be given the directory information for all projects. Once the downloaded project has been moved to this folder you should be able to run it from the epic games Unreal Engine library screen. NEEDS TO BE LAUNCHED THROUGH EPIC GAME TO BE FOUND FOR FIRST TIME.
